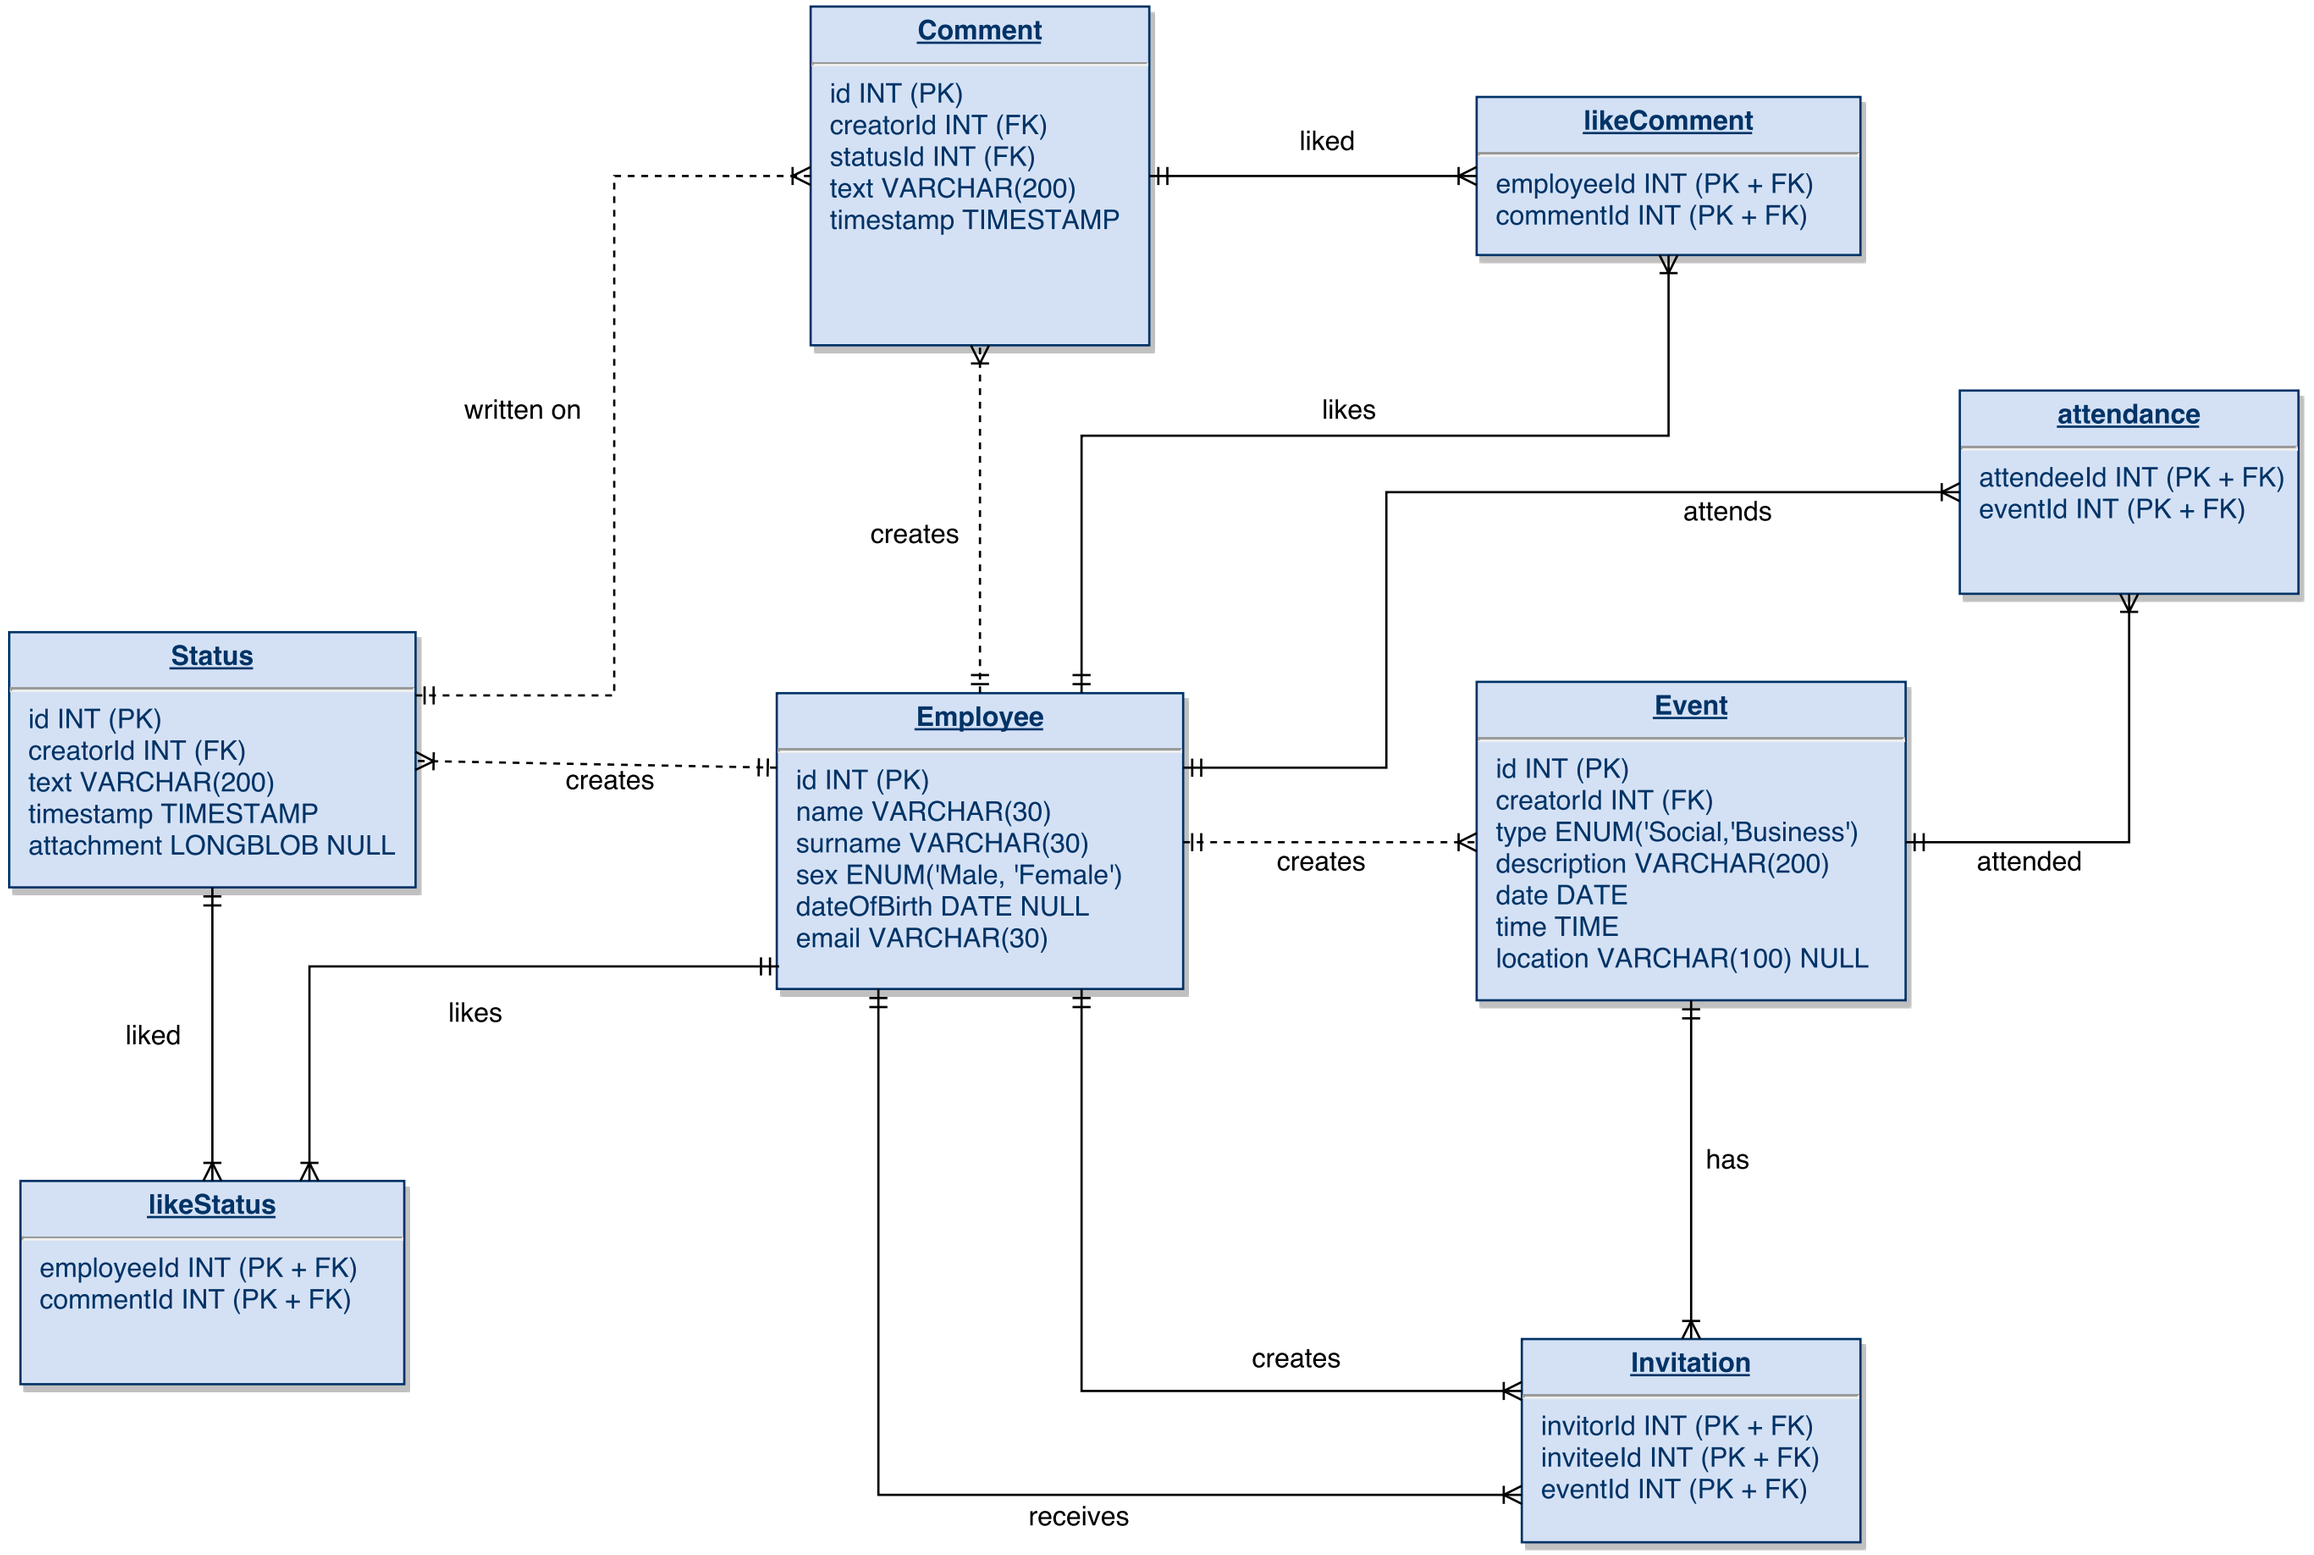
PK = Primary Key
FK = Foreign Key
Assume that all fields are NOT NULL unless NULL is specified



- Employees should be added without specifying an id. ID will be generated automatically using auto increment. Same applies to all other tables identified with an id (INT) field.
- When creating an invitation, the invitorId is set as the id of the invitation creator. Thus, the trigger will ensure that only the event creator can create invitations.
- LONGBLOB is used to store the attachment. We assume that data should be stored locally in the database, as opposed to somewhere externally and shared based on a link.
- Employees can register only once using their email. Therefore, email must be a unique field
